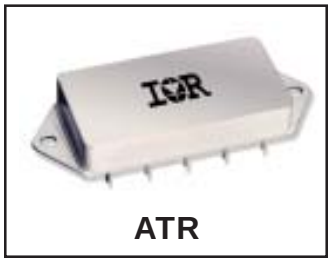
ATR28XXD SERIES

28V Input, Dual Output

ADVANCED ANALOG HYBRID-HIGH RELIABILITY DC/DC CONVERTERS



ATR

Description

The ATR28XXD Series of DC/DC converters feature high power density and an extended temperature range for use in military and industrial applications. Designed to MIL-STD-704D input requirements, these devices have nominal 28VDC inputs with ±12V and ±15V dual outputs to satisfy a wide range of requirements. The circuit design incorporates a pulse width modulated single forward topology operating in the feed-forward mode at a nominal switching frequency of 550KHz. Input to output isolation is achieved through the use of transformers in the forward and feedback circuits.

The advanced feedback design provides fast loop response for superior line and load transient characteristics and offers greater reliability and radiation tolerance than devices incorporating optical feedback circuits.

Three standard temperature grades are offered with screening options. Refer to Part Number section. They can be provided in a standard plug-in package for PC mounting or in a flanged package for more severe environments.

These converters are manufactured in a facility certified to MIL-PRF-38534. All processes used to manufacture these converters have been qualified to enable Advanced Analog to deliver compliant devices.

Four screening grades are available to satisfy a wide range of requirements. The CH grade converters are fully compliant to MIL-PRF-38534 for class H. The HB grade converters are processed to full class H screening but do not have class H element evaluation as required by MIL-PRF-38534. Both grades are fully tested and operate over the full military temperature range without derating of output power. The ES version is a full temperature device without the full class H or element evaluation. The non-suffix device is a low cost limited temperature range option. Variations in electrical, mechanical and screening can be accommodated.

Extensive computer simulation using complex modeling enables rapid design modification to be provided. Contact Advanced Analog with specific requirements.

Features

- 16 to 40 VDC Input Range (28 VDC Nominal)
- ±12V and ±15V Outputs Available
- Indefinite Short Circuit and Overload Protection
- 35 W/in^3 Power Density
- 30 Watt Output Power
- Fast Loop Response for Superior Transient Characteristics
- Operating Temperature Range from -55°C to +125°C
- Popular Industry Standard Pin-Out
- Resistance Seam Welded Case for Superior Long Term Hermeticity
- Ceramic Feed-thru Pins
- External Synchronization
- High Efficiency
- Shutdown from External Signal
- Military Screening

Specifications

T_{CASE} = -55°C to +85°C, V_{IN} = +28V ± 5% unless otherwise specified

ABSOLUTE MAXIMUM RATINGS

Notes to Specifications

1. Above +85°C case temperature, derate output power linearly to 0 at +115°C case.
2. Recovery time is measured from the initiation of the input transient to where V_{OUT} has returned to within ±1% of V_{OUT} at 50% load.
3. Turn-on delay time measurement is for either an application of power at the input or a signal at the inhibit pin.
4. Load current split equally between $+V_{OUT}$ and $-V_{OUT}$.
5. Up to 90% of Full Power is available from either output provided. The total power output does not exceed 30 watts.
6. 3W load on output under test, 3W to 27W on other output.
7. Sync. Input signal: V_{IL} = -0.5V Min, V_{IN} = 2.5V Min, 10% to 90% duty cycle,
   0.8V Max 11.5V Max

   0.8V Max, 11.5V Max

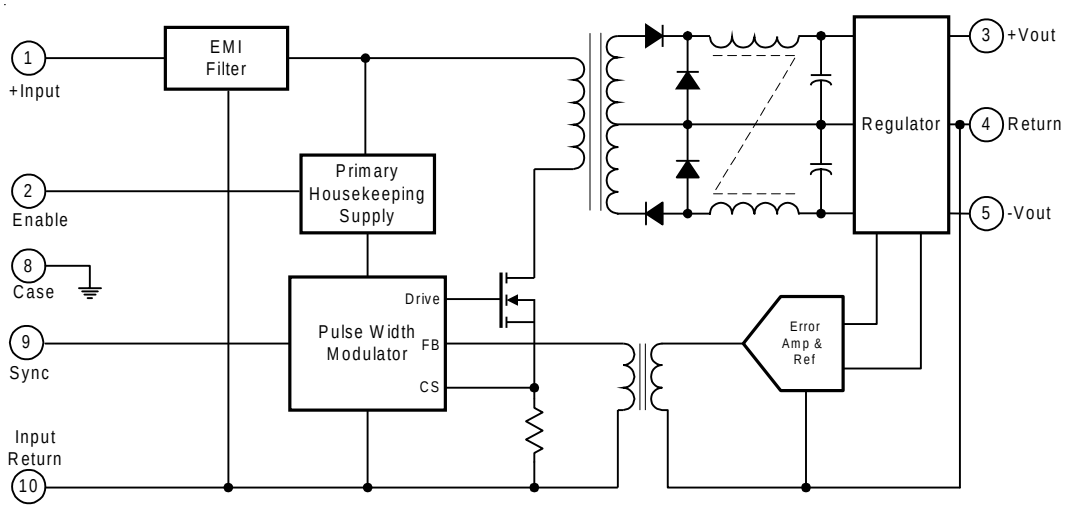
ATR28XXD Block Diagram



Application Information

Inhibit Function

Connecting the inhibit input (Pin 2) to input common (Pin 10) will cause the converter to shut down. It is recommended that the inhibit pin be driven by an open collector device capable of sinking at least 400µA of current. The open circuit voltage of the inhibit input is 11.5 ±1 VDC.

EMI Filter

An EMI filter (AFC461), available as an option, will reduce the input ripple current to levels below the limits imposed by MIL-STD-461B CEO3.

Device Synchronization

Whenever multiple DC/DC converters are utilized in a single system, significant low frequency noise may be generated due to slight difference in the switching frequencies of the converters (beat frequency noise). Because of the low frequency nature of this noise (typically less than 10KHz), it is difficult to filter out and may interfere with proper operation of sensitive systems (communications, radar or telemetry). The Advanced Analog ATR28xx converters provide a synchronizing input permitting synchronization of multiple converters to the frequency of the users system clock, thereby minimizing this type of noise.

Thermal Management

Assuming that there is no forced air flow, the package temperature rise above ambient (ΔT) may be calculated using the following expression:

$$\Delta T = 80\ A^{-0.7}\ P_d^{\ 0.85}\ (°C) \qquad (1)$$

where A = the effective surface area in square inhes(including heat sink if used), P_d = power dissipation in watts.

The total surface area of the ATR standard package is 7.34 square inches. If a worse case full load efficiency of 78% is assumed, then the case temperature rise can be calculated as follows:

$$P_d = P_{OUT}\left[\frac{1}{Eff} - 1\right] = 30\left[\frac{1}{78} - 1\right] = 8.5W$$

and $\Delta T = 80\ (7.34)^{-0.7}\ (8.5)^{0.85} = 122°C$

Hence, if $T_{AMBIENT}$ = +25°C, the DC/DC converter case temperature will be approximately 147°C if no heat sink or air flow is provided.

To calculate the heat sink area required to maintain a specific case temperature rise, equation (1) may be manipulated as follows:

$$A_{HEATSINK} = \left[\frac{\Delta T}{80 P_d^{0.85}}\right]^{-1.43} - A_{PKG}$$

As an example, if it is desired to limit the case temperature rise to a maximum of 50°C above ambient, the required effective heat sink area is:

$$A_{HEATSINK} = \left[\frac{50}{80(8.5)^{0.85}}\right]^{-1.43} - 7.34 = 19.1 in^2$$
